A dimly lit, open-plan office with several people working at desks equipped with multiple computer monitors. The office has a modern, industrial feel with exposed ceiling infrastructure and a staircase in the background. The text is overlaid on the left side of the image.

Pivotal

# Cloud Foundry Meetup

June 2016

Caleb Washburn

# About me....

- Advisory Solutions Architect @ Pivotal
- 18+ years in IT, mostly working within an enterprise
- Working with Spring based applications for 10+ year. Yes...when XML was the cool new thing
- Disclaimer: Work at Pivotal but my opinions are my own

# What we plan to go over...

- Building a simple micro-service and deploying to Cloud Foundry
- Enhance that microservice to add integration with Spring Cloud Config
- Enhance that to register with Spring Service Registry
- Build a 2nd microservice that consumes the first service using Spring Service Registry
- Enhance the 2nd service to add Circuit Breaker capability

# Your first microservice

# Microservice getting started

- 1) Get started by going to [start.spring.io](https://start.spring.io) and download a starter
- 2) Build it (we will use maven - mvn install)
- 3) Add a simple controller
- 4) Basic application.properties setup
- 5) Add a cf manifest
- 6) Deploy it to cloud foundry via cf push

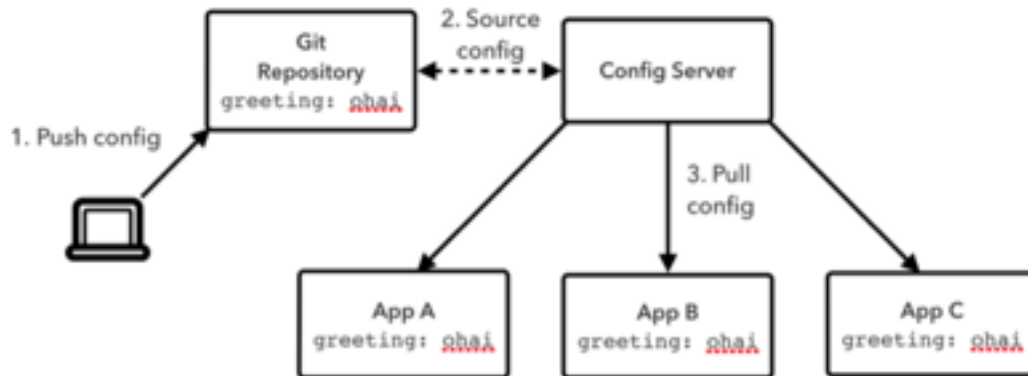

# Microservice getting started

**DEMO**

# Spring Cloud Config

# Spring Cloud Config Server

Leverages SVN or GIT for application configuration. Properties that you would normally put in properties files but now can externalize with a common approach.

# Spring Cloud Config Server

- Enabled through creating a service instance

```
cf create-service -c '{ "git": { "uri": "<Your GIT REPO URI>", "label": "master" } }' p-config-server standard config-server
```

- And binding to your application and restage

```
cf bind-service my-app config-server  
cf restage
```

- Remember to annotate any Spring beans that you want to dynamically refresh when configuration changes with `@RefreshScope` so a HTTP Post to `/refresh` will force a reload

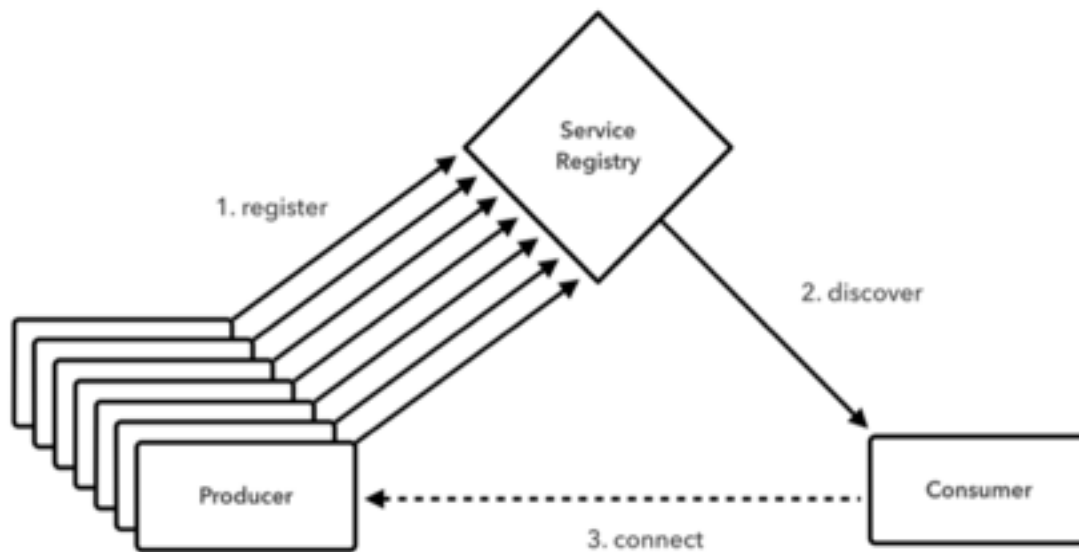

# Spring Cloud Config Server

**DEMO**

# Spring Service Registry

# Spring Service Registry

Allows for dynamic registry and discovery of services within a Cloud Foundry space. This enables microservices deployed into the same space to discover each other. There are 2 approaches to discovery either direct or router. Router mode registers the Cloud Foundry Go Router url with the service registry where direct registers the container IP/Port and bypasses the network routing layer. Based on Eureka Netflix's Service discovery server/client

# Spring Service Registry

- Enabled through the `@EnableDiscoveryClient` on your spring boot application
- For client side load-balancing via Ribbon in your microservice client. Annotate your injected `RestTemplate` with `@LoadBalanced`

`@Autowired`

`@LoadBalanced`

`RestTemplate restTemplate;`

- Create a service

**`cf create-service p-service-registry standard service-registry`**

- Bind it to your application

**`cf bind-service my-app service-registry`**

**`cf restage`**

- Dashboard is created to show state of service

**`cf service service-registry`** to get dashboard url for this service instance

# Spring Service Registry Service

**DEMO**

# Spring Service Registry Client

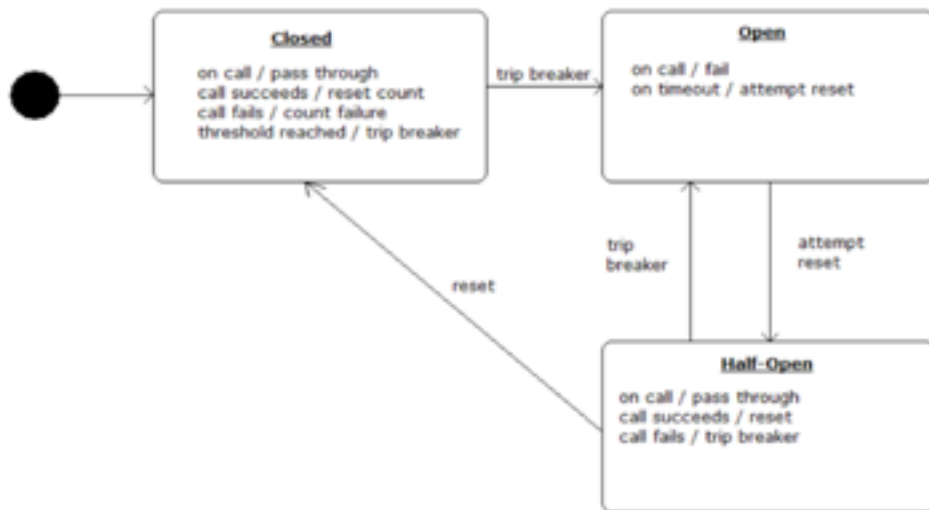

**DEMO**

# Spring Circuit Breaker Dashboard

# Spring Circuit Breaker Dashboard

Allows for a microservice client to configure a fallback if the downstream microservice is unavailable. This will kick in automatically and opens the circuit after a threshold of a failing calls has been exceeded. After the service is recovered it will automatically be added back into the call chain and the circuit will be closed. This is based on Hystrix Netflix latency and fault-tolerance library.

# Spring Circuit Breaker Dashboard

- Enabled with `@EnableCircuitBreaker` on your spring boot application
- Enabled through usage of `@HystrixCommand` annotation on method that invokes the service

- Create a service

**cf create-service p-circuit-breaker-dashboard standard circuit-breaker**

- Bind it to your application

**cf bind-service my-app circuit-breaker**

**cf restage**

- Dashboard is created to show state of service

**cf service circuit-breaker** to get dashboard url for this service instance

# Spring Circuit Breaker Dashboard

**DEMO**

A dark, atmospheric photograph of the Golden Gate Bridge in San Francisco, viewed from a high angle looking down the length of the bridge towards the foggy horizon. The bridge's iconic red-orange color is muted by the dark overlay.

# Pivotal®

Transforming How The World Builds Software

A photograph of the Golden Gate Bridge in San Francisco, viewed from a high angle on the Marin side. The bridge's iconic red-orange towers and suspension cables are prominent against a hazy, overcast sky. The bridge spans a deep, rocky gorge, with the ocean visible in the distance. The overall tone of the image is muted and atmospheric.

**Thank You**
